

Healthy People,
Safe Workplaces
Greener Planet.

OVERVIEW

It allows organizations to manage and track safety-related activities efficiently within a single platform, ensuring compliance, mitigating risks, and improving overall operational safety. By integrating HSE management into an ERP system, companies can create a safer, more compliant, and environmentally conscious workplace while improving overall operational efficiency.

KEY FEATURES OF AN HSE MODULE IN AN ERP SYSTEM INCLUDE:

1. Incident Reporting and Tracking

Allows employees to report accidents, near-misses, and unsafe conditions.

Tracks incidents in real-time and monitors corrective actions.

Generates reports and dashboards to analyse incident trends and ensure timely follow-ups.

2. Health Records

Health records in Web ERP and mobile app provide secure, real-time management of employee health information. Users can track medical histories, health benefits, and workplace incidents seamlessly across both platforms, ensuring compliance and supporting employee well-being.

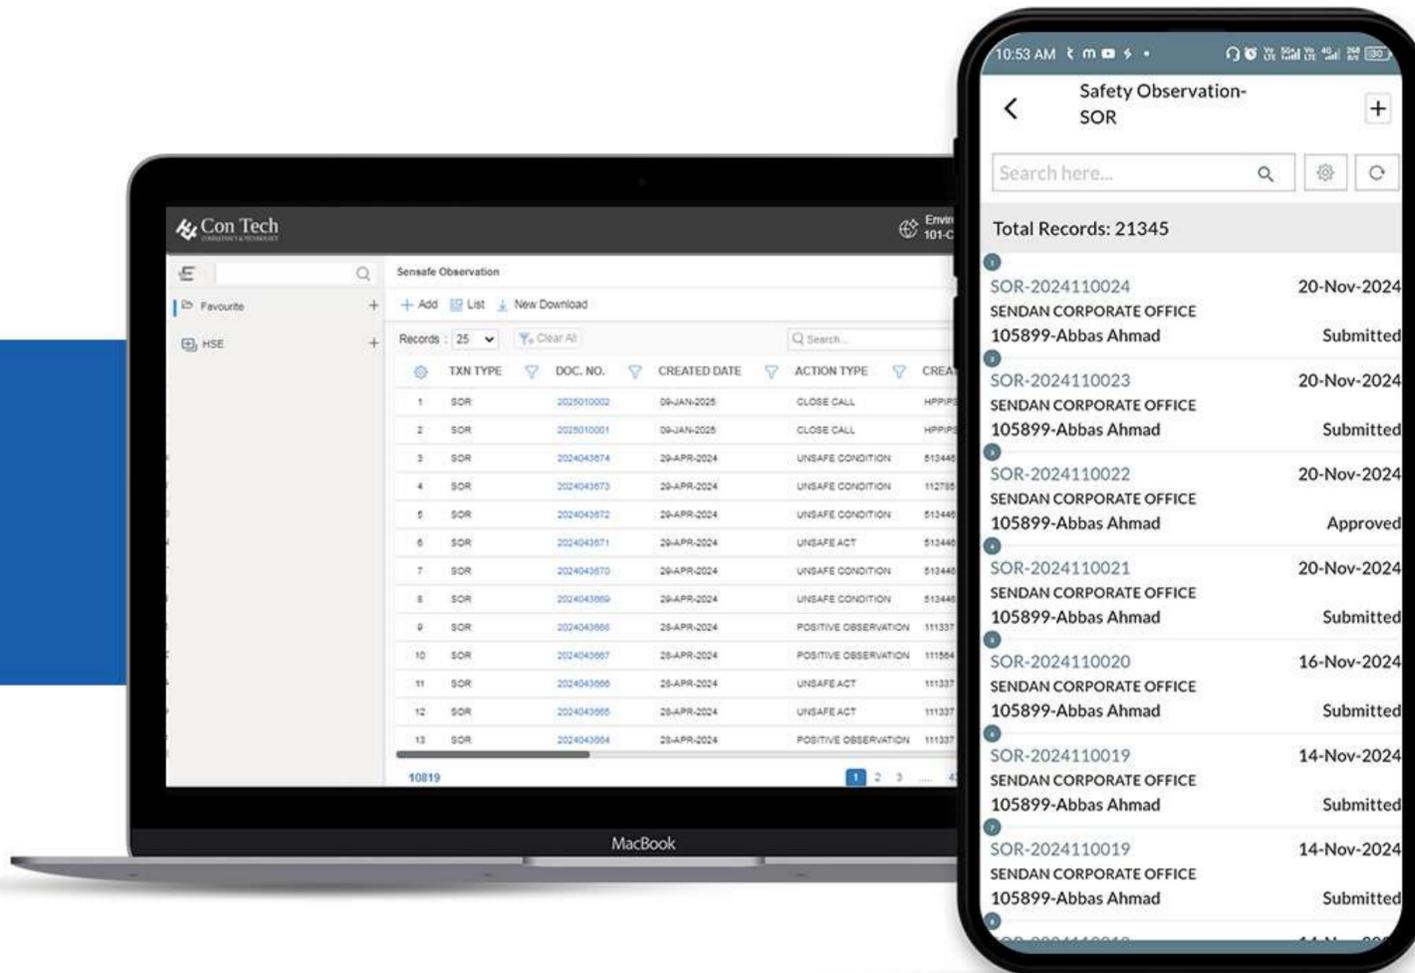

3. Safety observation

Safety observation refers to the systematic process of identifying, and analysing potential hazards, unsafe behaviours, or unsafe conditions in the workplace or any other environment where safety is a concern. The primary goal of safety observation programs is to prevent accidents, injuries, and incidents by proactively identifying risks and taking corrective actions.

The Overall Observations block provides a comprehensive snapshot of safety observations recorded within the specified timeframe. It serves as a key component in assessing the safety performance of the organization, highlighting trends, areas of improvement, and potential hazards.

Display the total number of safety observations recorded within a selected time frame (Daily, Weekly, Monthly etc).

Break down observations by type (e.g. unsafe act, unsafe conditions, near misses) to identify patterns.

SAFETY OBSERVATION PROCESS

01

Prepare for the observation.

02

Identify key observation areas.

03

Observe and document unsafe conditions or behaviours.

04

Provide immediate feedback.

06

Follow up on corrective actions.

05

Report findings and recommend actions.
